

Successful transmission rate vs. QKD availability: B4 vs. B5 (B1-B3 as context)

10 devices

1,000 devices

—●— B1 Classical -■- B2 PQC-only ...▲... B3 QKD-only -◆- B4 Static hybrid —★— B5 Adaptive hybrid

B4 (static hybrid, red) collapses as QKD availability falls; B5 (adaptive hybrid, blue) holds via PQC fallback -- the project's central behavioral claim. B1/B2/B3 (gray) are context: B1 and B2 never depend on QKD; B3 collapses with B4 (their curves coincide almost exactly -- not a rendering artifact). All are host-measured (x86-64; see environment manifest).
